

## VENTING OPTIONS SPEEDS INSTALLATION, MAXIMIZES VERSATILITY.

The application flexibility of Modine's separated-combustion unit heaters are greatly enhanced when coupled with concentric-vent kits. These kits utilize single-wall penetration for venting purposes, reducing installation and maintenance costs. Modine offers a horizontal-venting kit as standard equipment with each separated-combustion unit heater. A vertical venting option is also available, and venting with separate inlet and exhaust pipes remains an option. The two venting methods that utilize a concentric adapter assembly are further described below:

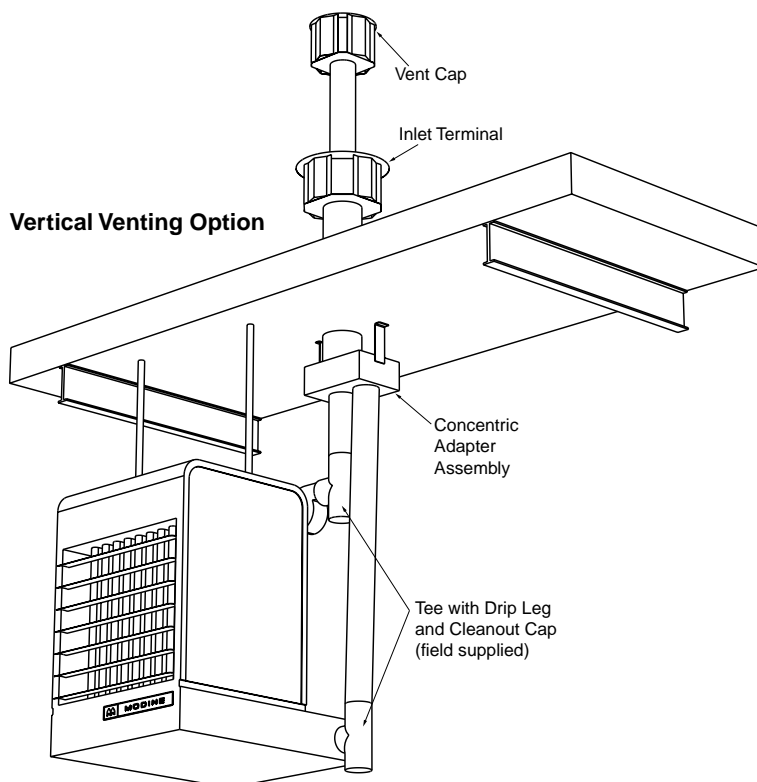

### Horizontal Venting Option

Modine provides a horizontal, concentric-vent kit as a standard feature with each PSH/BSH separated-combustion unit heater. The standard, horizontal kit includes a concentric adapter assembly, a vent termination cap and an air inlet guard assembly for the air inlet.

The vertical, concentric-venting adapter is an optional offering. The vertical kit includes a concentric adapter assembly, one vent termination cap and one inlet terminal. When ordering this option, the standard horizontal kit is not provided.

### Vertical Venting Option
